

Lead Management System (LMS) - Product Requirement Document

Version: 1.0

Technology Stack:

Frontend: React.js (Vite)

Backend: Laravel 12 REST API

Database: MySQL

This Product Requirement Document defines the complete vision, requirements, business logic and functional expectations for building a production-grade enterprise Lead Management System.

1. Project Overview

The Lead Management System is an enterprise CRM platform designed to help organizations capture, organize, assign, track and convert potential customers.

The system manages the complete sales lifecycle from first customer interaction until conversion or closure.

2. Product Vision

Build a scalable CRM solution where sales and marketing teams can efficiently manage leads, automate follow-ups, analyze performance and improve conversion rates using a centralized platform.

3. Business Problems Solved

- Manual lead tracking
- Missing follow-ups
- Poor sales visibility
- No performance analytics
- Unorganized customer communication
- Lack of ownership and accountability

4. User Roles

Super Admin:

Controls the complete system, users, permissions and configurations.

Admin:

Manages organization level activities and teams.

Sales Manager:
Assigns leads, monitors sales executives and reviews performance.

Sales Executive:
Works on assigned leads, updates status and performs follow-ups.

Marketing User:
Creates and manages marketing generated leads.

Viewer:
Read-only access for monitoring and reporting.

5. Core System Modules

Authentication & Authorization:
Secure login system with role based access control.

Dashboard:
Displays KPIs, lead statistics, conversion ratios, charts and performance data.

Lead Management:
Create, update, delete, search and manage complete lead information.

Lead Pipeline:
Tracks lead journey from creation to successful conversion.

Follow-up Management:
Manage calls, meetings, WhatsApp, email and visit follow-ups.

Communication Tracking:
Maintain complete customer interaction history.

Reports:
Generate sales, conversion, source and revenue reports.

Notifications:
Alert users about assignments, reminders and updates.

Import / Export:
Bulk import and export data using CSV, Excel and PDF.

User Management:
Manage users, roles and permissions.

6. Lead Lifecycle

7. Lead Data Requirements

Each lead contains:

- Name
- Company
- Email
- Phone
- Address
- Industry
- Lead Source
- Campaign
- Product Interest
- Budget
- Priority
- Current Status
- Assigned User
- Follow-up Date
- Notes
- Tags
- Documents

8. Business Rules

- Every lead must have an assigned owner.
- Status changes must generate activity logs.
- Follow-up reminders should notify responsible users.
- Duplicate leads should be detected.
- Deleted data should maintain audit history.
- Users only access data allowed by their permissions.

9. Permission Requirements

System permissions control:

- Lead creation
- Lead modification

- Lead deletion
- Lead assignment
- Report access
- User management
- System configuration

10. Enterprise Requirements

The LMS should include:

- Scalable architecture
- Secure APIs
- Role based permissions
- Activity logging
- Analytics dashboard
- Responsive interface
- Clean user experience
- Production quality code

11. Future Scope

Possible future improvements:

- AI based lead scoring
- Email automation
- WhatsApp API integration
- Mobile application
- Advanced CRM integrations
- Sales forecasting
